THE BEST KEYBOARD LAYOUT EDITOR

For Windows 10, 8, 7 and Vista (32- and 64-bit)

Keyboard customization under Windows has never been easy.

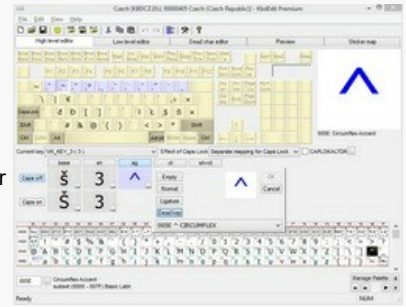

Fortunately, KbdEdit is here to turn it around: now it's never been easier! Twist your keyboard into a pretzel sooner than you can say "heterosyllabic".

NEW! Editable [NLS functions](#), enabling [multiple VK codes](#) per single key.

NEW! [Unicode search](#) by character name.

NEW! Main window layout is now [resizable](#).

NEW! Kbdedit now supports up to [15 modifier positions](#).

Stay up to date

The product is being actively developed - be sure to check [release notes](#) regularly.

Send your impressions about KbdEdit to info@kbedit.com - your feedback will be highly appreciated (and rewarded).

The Most Powerful Keyboard Editor Ever

Lean and blazingly fast

KbdEdit is written entirely in C++ language, whence its excellent performance and responsiveness. Code-bloat free: two self-sufficient exe files is all that is ever installed on your computer (only one file in the Demo version)

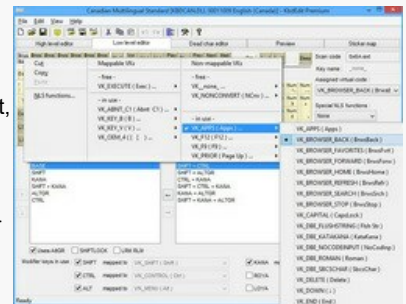

KbdEdit writes Windows DLL layout files directly and quickly, with no intermediary steps like code generation, compilation and linking.

Special and function keys reprogramming

KbdEdit is no ordinary keyboard mapper: not only can you assign any letter or special character to any key, but with the [Personal edition](#) you can [remap](#) physical position and function of any, and we mean ANY key: letter or digit, Control, Alt, Shift, Function, multimedia or cursor keys.

You can even reprogram such unyielding keys as Caps/Num/Scroll Lock and Numpad keys.

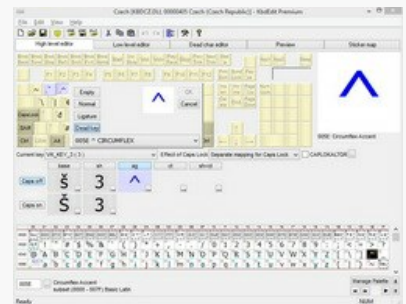

Missing the right Ctrl, which was expelled from your laptop's keyboard in favor of the "context menu" key you never use? With KbdEdit, nothing easier than bringing it back.

Unprecedented ease of use

Just start the program and play with it, within 10 minutes you too will become a keyboard layout expert.

With KbdEdit, all keyboard functions are at your fingertips, waiting for you to reprogram them to your taste - only one menu item, button click or drag&drop away.

Undo/Redo

You can experiment to your heart's content - multiple level [Undo/Redo](#) always gives you an easy route back.

Instant preview

Any change you make can be instantly tested in the [Preview](#) screen.

Don't waste time designing elaborate layouts only to discover they're ergonomic disasters once you try to use them. Test any change as soon as you make it.

Print your own keyboard stickers

With KbdEdit's [key cap stickers](#), you can make any physical keyboard match your custom layout key-for-key.

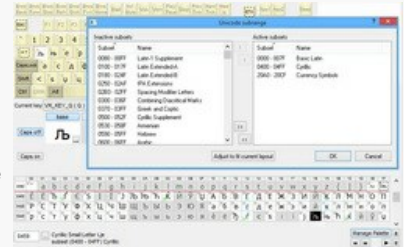

Comfortable Unicode navigation

[Unicode palette](#) at the bottom of the KbdEdit screen will soon become your best friend. It [adjusts](#) automatically to the current layout, displaying only character ranges that make sense for your language, and [highlights](#) characters that appear in the current layout..

Even better, you can [drag&drop](#) characters even from/to other applications - KbdEdit is a better CharMap than the Windows built-in CharMap itself

Unicode with its 65 536 code points will never intimidate you again.

Ligatures, Dead keys, Multilingual keyboards and much more

With the [Personal edition](#), you can use advanced layout features like [Ligatures](#) and customized [dead keys](#).

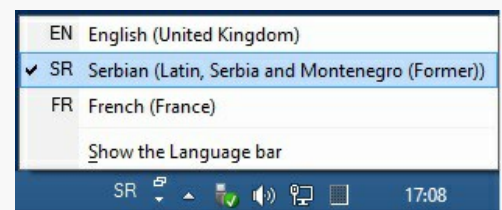

With the help of toggable [KANJI](#) modifier, you can even support [two](#) or [three](#) different languages on a single layout!

Don't lose your investment in MSKLC

KbdEdit seamlessly [imports KLC files](#) produced by Microsoft Keyboard Layout Creator. Not only does this make for a painless migration, it also enables the deployment of KLC files under 64-bit Windows, which cannot be achieved using MSKLC alone.

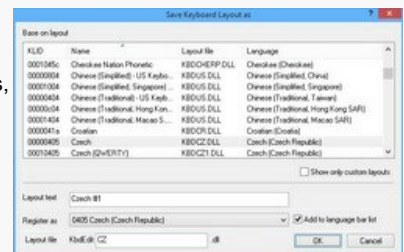

Easy deployment

With KbdEdit, your customized layout can become a part of your [favorite layout list](#) in no time, and from that point on it is accessible from any Windows application.

No harm is made to your system

The changes you make are localized strictly to the custom layouts created with KbdEdit. Windows standard layouts, as well as layouts created with other tools, are protected from any accidental damage.

Share your layouts

To deploy a custom layout elsewhere, you will only need to ["Export"](#) it and use the ["Import"](#) feature on the target computer.

The target does not even have to run a Full version of KbdEdit - the [Player edition](#), with its generous volume discount, offers a cost-effective way to deploy custom layouts on a large number of computers.

Alternatively, with KbdEdit [Premium](#) you can generate [stand-alone layout installer](#) packages which allow you to distribute to wide audience at no cost to the end user.
